I need to turn these off during a specific event, so I can't use shutdown -h now because it's a command that blocks the VM until the VM shuts down. I've been using gdmflexiserver and using the GUI to shut down the VM. This allows me to restart the VM at a later time, so I have less downtime and less to remember. We suggest that these differences reflect differences in the signal transduction mechanisms that ultimately result in CD69 expression.
